Modern antivirus programs do not show you what they do to your computer. Revealed: What viruses are really doing - Is antivirus suspicious of mobile technology? "People have different views about security and antivirus programs," says Dr. Marcus Kreutzer, a lecturer at the University of Stuttgart in Germany. "If someone says he does not use an antivirus program, I do not believe him." "But the results of many security researchers and independent analysts often differ," Kreutzer continues. "If they detect something suspicious, then we call that something a virus." "When does a virus hit the system?" says Ken Munro, a lecturer in operations research and information technology management at the University of York in England. Kreutzer told DW that when a virus hits a PC, it runs in the background. "The virus works using what it calls processes," Kreutzer says. "It prepares them. It attaches them to the task bar." A virus can also "pretend to be a clickable link, a program that you must run or a TV advertisement." An important issue Computer viruses are a fact of life in modern computing. They have been a part of computing for almost a century. But the methods used by viruses and antivirus programs are changing. In addition to the well known problems, such as double vision, poor depth perception, and difficulties in reading, stroke survivors also often experience loss of visual field. While most of the impairment in vision loss after stroke is permanent, there is evidence that the amount of visual field loss can be reduced with intensive rehabilitation. The overall goal of this study is to develop a new, inexpensive, objective visual field test that can be easily administered by therapists in the clinical setting. A novel approach is proposed for measuring contrast sensitivity thresholds across the central visual field in stroke patients as part of an intervention for vision loss. This project will be developed in 2 phases. During the first phase (unfunded), the feasibility of the new visual field test will be evaluated using a normal group of subjects (aged 20-40 years) and
